A HOME IS NOT A HOUSE

Reyner Banham

illustrated by François Dallegret

When your house contains such a complex of piping, flues, ducts, wires, lights, inlets, outlets, ovens, sinks, refuse disposers, hi-fi reverberators, antennae, conduits, freezers, heaters—when it contains so many services that the hardware could stand up by itself without any assistance from the house, why have a house to hold it up?

When the cost of all this tackle is half of the total outlay (or more, as it often is) what is the house doing except concealing your mechanical pudenda from the stares of folks on the sidewalk? Once or twice recently there have been buildings where the public was genuinely confused about what was mechanical services, what was structure—many visitors to Philadelphia take quite a time to work out that the floors of Louis Kahn’s laboratory towers are not supported by the flanking brick duct boxes, and when they have worked it out, they are inclined to wonder if it was worth all the trouble of giving them an independent supporting structure.

No doubt about it, a great deal of the attention captured by those labs derives from Kahn’s attempt to put the drama of mechanical services on show—and if, in the end, it fails to do that convincingly, the psychological importance of the gesture remains, at least in the eyes of his fellow architects. Services are a topic on which architectural practice has alternated capriciously between the brazen and the coy—there was the grand old Let-it-dangle period, when every ceiling was a mess of gaily painted entrails, as in the council chambers of the US building, and there have been fits of prudery when even the most innocent anatomical details have been hurriedly veiled with a suspended ceiling.

Basically, there are two reasons for all this blowing hot and cold (if you will excuse the air-conditioning industry’s oldest working pun). The first is that mechanical services are too new to have been absorbed into the proverbial wisdom of the profession: none of the great slogans—Form Follows Function, accuses la structure, Firmness Commodity and Delight, Truth to Materials, Wenig ist Mehr—is much use in coping with the mechanical invasion. The nearest thing, in a significantly negative way, is Le Corbusier’s “PourLedoux, c’était facile—pas de tubes,” which seems to be gaining proverbial-type currency as the expression of a profound nostalgia for the golden age before piping set in.

The second reason is that the mechanical invasion is a fact, and architects—especially American architects—sense that it is a cultural threat to their position in the world. American architects are certainly right to feel this, because their professional speciality, the art of creating monumental spaces, has never been securely established on this continent. It remains a transplant from an older culture and architects in America are constantly harking back to that culture. The generation of Stanford White and Louis Sullivan were prone to behave like émigrés from France, Frank Lloyd Wright was apt to take cover behind sentimental Teutonicisms like Lieber Meister, the big boys of the Thirties and...
ANATOMY OF A DWELLING

With very little exaggeration, this baroque ensemble of domestic gadgetry epitomizes the intestinal complexity of gracious living—in other words, this is the junk that keeps the pad swinging. The house itself has been omitted from the drawing, but if mechanical services continue to accumulate at this rate it may be possible to omit the house in fact.
Dallegret's 20-20 hindsight and foresight produced this historical capriccio from the First Machine Age well before the present article was first mooted. In the mode of its time, services are in a separate outhouse instead of being a mechanical clip-on.

SUPER-COUPE DE LONG-WEEK-END, 1927

The present mobile home is a mess, visually, mechanically, and in its relationship to the permanent infrastructure of civilization. But if it could be rendered more compact and mobile, and be uprooted from its dependency on static utilities, the trailer could fulfill its promise to put a nation on wheels. The kind of mobile utility pack suggested here does not exist yet, but it may be no farther over the hill than its coming-attraction style would suggest.

TRAILMASTER GTO TRANSCONTINENTAL

Trailmaster GTO 2 + 2 with beefed rear axle and drive-train
Fifties came from Aachen and Berlin anyhow, the pacesetters of the Fifties and Sixties are men of international culture like Charles Eames and Philip Johnson, and so too, in many ways, are the coming men of today, like Myron Goldsmith.

Left to their own devices, Americans do not monumentalize or make architecture. From the Cape Cod cottage, through the balloon frame to the perfection of permanently pleated aluminum siding with embossed wood-graining, they have tended to build a brick chimney and lean a collection of sheds against it. When Groff Conklin wrote (in "The Weather-Conditioned House") that "A house is nothing but a hollow shell...a shell is all a house or any structure in which human beings live and work, really is. And most shells in nature are extraordinarily inefficient barriers to cold and heat..." he was expressing an extremely American view, backed by a long-established grass-roots tradition.

And since that tradition agrees with him that the American hollow shell is such an inefficient heat barrier, Americans have always been prepared to pump more heat, light and power into their shelters than have other peoples. America's monumentality is, I suppose, the great outdoors—the porch, the terrace, Whitman's rail-traced Rhine, Kerouac's infinite road, and now, the Great Up There. Even within the house, Americans rapidly learned to dispense with the partitions that Europeans need to keep space architectural and within bounds, and long before Wright began blundering through the walls that subdivided polite architecture into living room, games room, and room, gym room etc., humble Americans had been slipping into

Bryan Banham, British architectural historian and critic, currently holds a fellowship from the Graham Foundation to investigate the role of mechanical services in the rise of modern architecture. "A Home Is Not a House" is a direct product of this research, and the illustrations by Moroccan-born architect designer and car-buff François Dallegret add a footnote whose importance, Banham says, "goes beyond their quality as graphics—they demonstrate the hollowness of the fear of many architects that acceptance of the dominance of environmental machinery will be 'the end of creativity.'"

a way of life adapted to informally planned interiors that were, effectively, large single spaces.

Now, large single volumes wrapped in flimsy shells have to be lighted and heated in a manner quite different and more generous than the cubic interiors of the European tradition around which the concept of domestic architecture first crystallized. Right from the start, from the Franklin stove and the kerosene lamp, the American interior has had to be better served if it was to support a civilized culture, and this is one of the reasons that the U.S. has been the forcing ground of mechanical services in buildings—so if services are to be felt anywhere as a threat to architecture, it should be in America.

"The plunger is the quartermaster of American culture," wrote Adolf Loos, father of all European platitudes about the superiority of U.S. plumbing. He knew what he was talking about; his brief visit to the States in the Nineties convinced him that the outstanding virtues of the American way of life were its informality (no need to wear a top hat to call on local officials) and its cleanliness—which was bound to be noticed by a Viennese with as highly developed a set of Freudian compulsions as he had. That obsession with clean (which can become one of the higher absurdities of America's lysol-breathing Kleenez-culture) was another psychological motive that drove the nation toward mechanical services. The early justifications of air-conditioning were not just that people had to breathe: Konrad Meier ("Reflections on Heating and Ventilating," 1904) wrote fastidiously of "...excessive amounts of water vapor, sickly odors from respiratory organs, unclean teeth, perspiration, unduly clothing, the presence of microbes due to various conditions, stuffy air from dusty carpets and draperies...cause greater discomfort and greater ill health."

(Have a wash, and come back for the next paragraph.)

Most pioneer air-conditioning men seem to have been nose-obsessed in this way: best friends could just about force themselves to tell America of her national B.O.—and then, compulsive salesmen to a nun, promptly prescribed their own patent improved panacea for ventilating the hell out of her. Somewhere among these clustering concepts—cleanliness, the lightweight shell, the mechanical services,
the informality and indifference to monumental architectural values, the passion for the outdoors—there always seemed to me to lurk some elusive master concept that would never quite come into focus. It finally came clear and legible to me in June 1964, in the most highly appropriate and symptomatic circumstances.

I was standing up to my chest hair in water, making home movies (I get that NASA kick from taking expensive hardware into hostile environments) at the campus beach at Southern Illinois. This beach combines the outdoor and the clean in a highly American manner—sensibly it is the ole swimmin' hole of Huckleberry Finn tradition, but it is properly police (by sophomore lifeguards sitting on Eames chairs on poles in the water) and it's chlorinated too. From where I stood, I could see not only immensely elaborate family barbecues and picnics in progress on the sterilized sand, but also, through and above the trees, the basketry interlace of one of Buckminster Fuller's experimental domes. And it hit me then, that if dirty old Nature could be kept under the proper degree of control (sex left in, streptococci taken out) by other means, the United States would be happy to dispense with architecture and buildings altogether.

Bucky Fuller, of course, is very big on this proposition: his famous non-rhetorical question, "Madam, do you know what your house weighs?" articulates a subversive suspicion of the monumental. This suspicion is inarticulately shared by the untold thousands of Americans who have already shed the deadweight of domestic architecture and live in mobile homes which, though they may never actually be moved, still deliver rather better performance as shelter than do ground-anchored structures costing at least three times as much and weighing ten times more. If someone could devise a package that would effectively disconnect the mobile home from the dangling wires of the town electricity supply, the bottled gas containers insecurely perched on a packing case and the semi-unspoken sanitary ar-

**TRANSPORTABLE STANDARD-OF-LIVING PACKAGE**
ragnements that stem from not being connected to the main sewer—then we should really see some changes. It may not be so far away either; defense cutbacks may send aerospace spin-off spinning in some new directions quite soon, and that kind of miniaturization-talent applied to a genuinely self-contained and regenerative standard-of-living package that could be towed behind a trailer home or dropped off at depots across the face of the nation. Avis might still become the first in U-Tility, even if they have to go on being a lying second in car hire.

Out of this might come a domestic revolution beside which modern architecture would look like Kiddibrix, because you might be able to dispense with the trailer home as well. A standard-of-living package (the phrase and the concept are both Buckminster Fuller's) that really worked might, like so many sophisticated inventions, return Man nearer to a natural state in spite of his complex culture (much as the supersession of the Morse telegraph by the Bell Telephone restored his power of speech nationwide). Man started with two basic ways of controlling environment: one by avoiding the issue and hiding under a rock, tree, tent or roof (this led ultimately to architecture as we know it) and the other by actually interfering with the local meteorology, usually by means of a campfire, which, in a more polished form, might lead to the kind of situation now under discussion. Unlike the living space trapped with our forebears under a rock or rooftop, the space around a campfire has many unique qualities which architecture cannot hope to equal, above all, its freedom and variability.

The direction and strength of the wind will decide the main shape and dimensions of that space, stretching the area of tolerable warmth into a long oval, but the output of light will not be affected by the wind, and the area of tolerable illumination will be a circle overlapping the oval of warmth. There will thus be a variety of environmental choices balancing light against warmth according to need and interest. If you want to do close work, like shrinking a human head, you sit in one place, but if you want to sleep you curl up somewhere different; the floating kneel- or-bones game would come to rest somewhere quite different to the environment that suited the meeting of the initiative-rates steering committee...and all this would be jin dandy if campfires were not so perishing inefficient, unreliable, smoky and the rest of it.

But a properly set-up standard-of-living package, breathing out warm air along the ground (instead of smogging in cold along the ground like a campfire), radiating soft light and Dionne Warwick in heart-warming stereo, with well-aged protein turning in an infrared glow in the rotisserie, and the ice-maker discreetly coughing cubes into glasses on the swing-out bar—this could do something for a woodland glade or creek-side rock that Playboy could never do for its penthouse. But how are you going to manhandle this hunk of technology down to the creek? It doesn't have to be that massive; aerospace needs, for instance, have done wild things to solid-state technology, producing even tiny refrigerating transistors. They don't as yet mop up any great quantity of heat, but what are you going to do in this glade anyhow—put a whole steer in deep-freeze? Nor do you have to manhandle it—it could ride on a cushion of air (its own air-conditioning output, for instance) like a hovercraft or domestic vacuum cleaner.

All this will eat up quite a lot of power, transistors notwithstanding. But one should remember that few Americans are ever far from a source of between 100 and 400 horsepower—the automobile. Beefed-up car batteries and a self-reeling cable drum could probably get this package breathing warm bourbon fumes o'er Eden long before microwave power transmission or miniaturized atomic power plants come

To the man who has everything else, a standard-of-living package such as this could offer the ultimate goody—the power to impose his will on any environment to which the package could be delivered; to enjoy the spatial freedom of the nomadic campfire without the smell, smoke, ashes and mess; and the luxuries of appliance-land without those encumbrances of a permanent dwelling.
in. The car is already one of the strongest arms in America’s environ-
mental weaponry, and an essential component in one non-arichitec-
tural anti-building that is already familiar to most of the nation—the
drive-in movie house. Only, the word house is a manifest misnomer—
just a flat piece of ground where the operating company provides
visual images and piped sound, and the rest of the situation comes on
wheels. You bring your own seat, heat and shelter as part of the car.
You also bring Coke, cookies, Kleenex, Chesterfields, spare clothes,
shoes, the Pill and god-what else they don’t provide at Radio City.

The car, in short, is already doing quite a lot of the standard-of-
living package’s job—the smoochy couple dancing to the music of
the radio in their parked convertible have created a ballroom in the
wilderness (dance floor by courtesy of the Highway Dept. of course)
and all this is parasitical till it starts to rain. Even then, you’re not
licked—it takes very little air pressure to inflate a transparent Mylar
airdome, the conditioned-air output of the mobile package might
be able to do it, with or without a little boosting, and the dome itself,
folded into a parachute pack, might be part of the package. From
within your thirty-foot hemisphere of warm dry lebeousum you
could have spectacular ringside views of the wind felling trees, snow
swirling through the glade, the forest fire coming over the hill or
Constance Chatterley running swiftly to you know whom through the
downpour.

But... surely this is not at home, you can’t bring up a family in
a polythene bag? This can never replace the time-honored ranch-style
tri-level standing proudly in a landscape of five defeated shrubs,
flanked on one side by a ranch-style tri-level with six shrubs and on
the other by a ranch-style tri-level with four small boys and a private
dust bowl. If the countless Americans who are successfully raising
nice children in trailers will excuse me for a moment, I have a few
suggestions to make to the even more countless Americans who are so
insecure that they have to hide inside fake monuments of Permnastole
and instant rooting. There are, admittedly, very sound day-to-day
advantages to having warm broadloom on a firm floor underfoot,
rather than pine needles and poison ivy. America’s pioneer house
builders recognized this by commonly building their brick chimneys
on a brick floor slab. A transparent airdome could be anchored to
such a slab just as easily as could a balloon frame, and the standard-
of-living-package could hover busily in a sort of glorified barbecue
pit in the middle of the slab. But an airdome is not the sort of thing
that the kids, or a distracted Pumpkin-eater could run in and out of
when the fit took them—believe me, fighting your way out of an airdome
can be worse than trying to get out of a collapsed rain-soaked
tent if you make the wrong first move.

But the relationship of the services-kit to the floor slab could be
re-arranged to get over this difficulty; all the standard-of-living
tackle (or most of it) could be re-deployed on the upper side of a
sheltering membrane floating above the floor, radiating heat, light
and what-not downwards and leaving the whole perimeter wide-open
for random egress—and equally casual ingress, too, I guess. That
crazy modern-movement dream of the interpenetration of indoors
and outdoors could become real at last by abolishing the door. Techi-
nically, of course, it would be just about possible to make the power-
membrane literally float, hovercraft style. Anyone who has had to
stand in the ground-effect of a helicopter will know that this solution
has little to recommend it apart from the instant disposal of waste
paper. The noise, power consumption and physical discomfort would
be really something wild. But if the power-membrane could be carried
on a column or two, here and there, or even on a brick-built bathroom
unit, then we are almost in sight of what might be technically possible
before the Great Society is much older.

The basic proposition is simply that the power-membrane should
blow down a curtain of warmed/cooled/conditioned air around the
perimeter of the windward side of the un-house, and leave the sur-
rounding weather to waft it through the living space, whose relation-
ship in plan to the membrane above need not be a one-to-one relation-
ship. The membrane would probably have to go beyond the limits of
the floor slab, anyhow, in order to prevent rain blow-in, though the
air-curtain will be active on precisely the side on which the rain is
blowing and, being conditioned, will tend to mop up the moisture as
it falls. The distribution of the air-curtain will be governed by various
electronic light and weather sensors, and by that radical new inven-
tion, the weathervane. For really foul weather automatic storm shut-
ers would be required, but in all but the most wildly incontinent
climates, it should be possible to design the conditioning kit to deal
with most of the weather most of the time, without the power con-
sumption becoming ridiculously greater than for an ordinary ineffi-
cient monumental type house.

Obviously, it would still be appreciably greater, but this whole
argument hinges on the observation that it is the American Way to
spend money on services and upkeep rather than on permanent
structure as do the peasant cultures of the Old World. In any case,
we don’t know where we shall be with things like solar power in the
next decade, and to anyone who wants to entertain an almost-possible
vision of air-conditioning for absolutely free, let me recommend
Shortstack (another smart trick with a polythene tube) in the Decay
ber 1964 issue of Analog. In fact, quite a number of the obvious
common sense objections to the un-house may prove to be self-
evaporating: for instance, noise may be no problem because there
would be no surrounding wall to reflect it back into the living space,
and, in any case, the constant whisper of the air-curtain would pro-
vide a fair threshold of loudness that sounds would have to beat before
they began to be comprehensible and therefore disturbing. Bags! Wild
life? In summer they should be no worse than with the doors and
windows of an ordinary house open; in winter all right-thinking
creatures either migrate or hibernate; but, in any case, why not
encourage the normal processes of Darwinian competition to tidy up
the situation for you? All that is needed is to trigger the process by
means of a general purpose lure; this would radiate mating calls and
sex scents and thus attract all sorts of mutually incompatible pre-
dators and prey into a compact pool of unspeakable carnage. A
closed-circuit television camera could relay the state of play to a
In the present state of the environmental art, no mechanical device can make the rain go back to Spain; the standard-of-living package is apt to need some sort of an umbrella for emergencies, and it could well be a plastic dome inflated by conditioned air blown out by the package itself.
The goal of present trends in domestic mechanization appears to be ever-more-flimsy structure that is made habitable by ever-more-massive machinery, and the Power-Membrane house then pushes this idea to its logical/Illogical conclusion—the open plan to end open plans, a wallless, garden house sheltering under the spreading arms of the ultimate appliance. Architecture-world faint hearts who fear this total condition as the leviathan that will trample down their ancient art should observe how near Dallegret has come to making a monument of the Power-Membrane; like true-blue breeding, architecture will out, even in the most unlikely circumstances.

screen inside the dwelling and provide a twenty-four-hour program that would make the ratings for Bonanza look like chicken feed.

And privacy? This seems to be such a nominal concept in American life as factually lived that it is difficult to believe that anyone is seriously worried. The answer, under the suburban conditions that this whole argument implies, is the same as for the glass house architects were designing so busily a decade ago—more sophisticated landscaping. This, after all, is the homeland of the bulldozer and the transplantation of grown trees—why let the Parks Commissioner have all the fun?

As was said above, this argument implies suburbia which, for better or worse, is where America wants to live. It has nothing to say about the city, which, like architecture, is an insecure foreign growth on the continent. What is under discussion here is an extension of the Jeffersonian dream beyond the agrarian mentality of Frank Lloyd Wright's Usonian/Broadacre version—the dream of the good life in the clean countryside, power-point homesteading in a paradise garden of appliances. This dream of the un-house may sound very anti-architectural but it is so only in degree, and architecture deprived of its European roots but trying to strike new ones in an alien soil has come close to the anti-house once or twice already. Wright was not joking when he talked of the "destruction of the box," even though the spatial promise of the phrase is rarely realized to the full in the all-too-solid fact. Grass-roots architects of the plains like Bruce Goff and Herb Greene have produced houses whose supposed monumental
lem is clearly of little consequence to the functional business of living in and around them.

But it is in one building that seems at first sight nothing but monumental form that the threat or promise of the un-house has been most dearly demonstrated—the Johnson House at New Canaan. So much has been misleadingly said (by Philip Johnson himself, as well as others) to prove this a work of architecture in the European tradition, that its many intensely American aspects are usually missed. Yet when you have dug through all the erudition about Ledoux and Malevich and Palladio and stuff that has been published, one very suggestive source or prototype remains less easily explained away—the shoddily persistence in Johnson’s mind of the visual image of a burred-out New England township, the insubstantial shells of the houses consumed by the fire, leaving the brick floor slabs and standing chimneys. The New Canaan glass-house consists essentially of just these two elements, a heated brick floor slab, and a standing unit which is a chimney/fireplace on one side and a bathroom on the other.

Around this has been draped precisely the kind of insubstantial shell that Conklin was discussing, only even less substantial than that. The roof, certainly, is solid, but psychologically it is dominated by the absence of visual enclosure all around. As many pilgrims to this site have noticed, the house does not stop at the glass, and the terrace, and the trees beyond, are visually part of the living space in winter, physically and operationally so in summer when the four doors are open. The “house” is little more than a service core set in infinite space, or alternatively, a detached porch looking out in all directions at the Great Out There. In summer, indeed, the glass would be a bit of a nonsense if the trees did not shade it, and in the recent searching fall, the sun reaching in through the bare trees created such a greenhouse effect that parts of the interior were acutely uncomfortable—the house would have been better off without its glass walls.

When Philip Johnson says that the place is not a controlled environment, however, it is not these aspects of undisciplined glazing he has in mind, but that “when it gets cold I have to move toward the fire, and when it gets too hot I just move away.” In fact, he is simply exploiting the campfire phenomenon (he is also pretending that the floor-heating does not make the whole area habitable, which it does) and in any case, what does he mean by a controlled environment? It is not the same thing as a uniform environment, it is simply an environment suited to what you are going to do next, and whether you build a stone monument, move away from the fire or turn on the air-conditioning, it the same basic human gesture you are making.

Only, the monument is such a ponderous solution that it astonishes me that Americans are still prepared to employ it, except out of some profound sense of insecurity, a persistent inability to rid themselves of those habits of mind they left Europe to escape. In the open-fronted society, with its social and personal mobility, its interchangeability of components and personnel, its gadgetry and almost universal expendability, the persistence of architecture-as-monumental-space must appear as evidence of the sentimentality of the tough.
